1 Introduction

1.1 Purpose & scope

The NZ Transport Agency (Transport Agency) is proposing to construct and operate a new section of State Highway 3 (SH3), generally between Uruti and Ahititi to the north of New Plymouth. The Transport Agency lodged applications for resource consents and a Notice of Requirement on 15 December 2017 to alter the existing SH3 designation, to enable the Mt Messenger Bypass project (the Project) to proceed. A full description of the Project including its design, construction and operation is provided in the Assessment of Effects on the Environment Report, contained in Volume 1: AEE, and is shown on the Drawings in Volume 2: Drawing Set. This application included a Ground Contamination – Preliminary Site Investigation (PSI)¹ and a Draft Contaminated Land Management Plan (Draft CLMP)². The PSI and Draft CLMP provide specialist input relating to the potential for adverse effects relating to the disturbance of potentially contaminated land and management of disturbance of contaminated land (if present) for the Project alignment.

The PSI and Draft CLMP detailed the requirement for soil sampling and testing, commensurate with the requirements of a detailed site investigations (DSI), to be undertaken prior to the commencement of any ground disturbance. Property access to enable this investigation was permitted in late December 2017 and the information from the soil sampling and testing are detailed in this report.

This investigation has been completed to assess whether the potentially contaminating activities as described by MfE Hazardous Activities Industrial List (HAIL) identified in the PSI have resulted in contaminants present in soil along the proposed alignment, and implications for the associated works.

The scope of work for this investigation comprised:

- Review of the PSI;
- Excavation of 14 test pits and 6 hand augers to a maximum depth of 2.2m or refusal (whichever first encountered) along the proposed alignment as informed by the PSI;
- Logging the soils encounter;
- Collection of soil samples from various depths at each location for analytical testing;
- Laboratory analysis of soil samples for a range of potential contaminants; and
- Preparation of this report to document the work undertaken and the findings of these investigations.

This report has been prepared in general accordance with the requirements for a DSI referred to in the Resource Management (National Environmental Standard for Assessing and

2 Project setting

2.1 Project location and description

The alignment is situated to the east of existing SH3 through the Mount Messenger area. The alignment ties-in to the existing SH3 at topographical flats to the north and south of Mount Messenger approximately 1km south of Ahititi and 6.4km north of Uruti, respectively.

The proposed alignment intersects a number of rural zoned properties. The details of these properties and the proposed alignment are provided in Table 2.1 below and shown on Figure 1 (Appendix A:).

As stated in Table 11.1 of the Assessment of Effects on the Environment (December 2017), there are no consented water takes downstream of the Project construction water takes. While the site is generally very remote and sparsely populated, it is possible that there are permitted activity water takes related to agricultural use in the vicinity of the Project site.

2.2 Published geology

The published geology beneath the alignment is described by Edbrooke⁴ as interbedded fine to very fine-grained sandstone and mudstone or siltstone of the Mount Messenger Formation.

2.3 Hydrology and groundwater

The alignment traverses two surface water catchments. These are the Tongaporutu Catchment in the north and the Mimi Catchment to the south. The boundaries of these catchments are defined by the high points of the proposed alignment adjacent to the summit of Mount Messenger.

Tributaries in the Tongaporutu Catchment feed north into a valley which forms into the defined water course of the Mangapepe Stream. Tributaries of the Mimi Catchment flow south to a low marsh/ wetland and form into the defined water course of the Mimi River.

Groundwater on site is generally shallow. In the parts of the Project site which intersect valley floors, groundwater is likely to be near or at the ground surface level. In parts of the

⁴ Edbrooke, S.W. (compiler) 2005. Geology of the Waikato area. Institute of Geological and Nuclear Sciences 1:250 000 geological map 4. 1 sheet + 68 p. Lower Hutt, New Zealand: Institute of Geological and Nuclear Sciences Limited. Lower Hutt, New Zealand.

Project site raised above valleys or on ridgelines, groundwater is likely to be approximately 2–3m in depth. Groundwater flow is expected to follow topography into two main stream valleys through which the Project area runs.

2.4 Potential contamination sources

Potentially contaminating (or HAIL) activities have been identified to have and/or more likely than not to have occurred along the Project alignment as documented in the PSI. The HAIL activities, including the potential contaminants associated with each of the activities and an assessment of the likely extent of contamination, are summarised in Table 2.2.

Locations of the soil sampling locations which have been undertaken as part of this investigation to evaluate the areas of potential contamination are also outlined in Table 2.2 and shown on Figures 3a and 3b (Appendix A).

Table 2.2 – Potential for contamination

Land use/ activity	Potential contaminants	Likelihood, magnitude and possible extent of contamination	HAIL reference	Sample Locations
Fly tipping along existing SH3 and farm dumps at the dry stock farms at the northern and southern ends of the proposed alignment	Various depending on type of waste. May include (but not limited to) gross refuse, biological hazards, heavy metals, hydrocarbons and agrichemicals	<p>Review of environmental incidents held by TRC indicate that the eastern banks of the existing SH3 have been subject to fly tipping and offal disposal. This is typically concentrated at pullover bays and in particular the public rest areas adjacent to the summit of Mount Messenger. A number of incidents are also recorded of dead stock being dumped and found in waterways of the area.</p> <p>Therefore the areas of the proposed earthworks associated with the proposed alignment adjacent to the existing SH3 may encounter refuse and/ or contaminated soils impacted by dumped material.</p> <p>Furthermore, two incidents are recorded of associated waste disposal to land within the southern property along the proposed alignment. One of the incidents included the disposal of stripped cars into a drained water course following a landslip onto the property from the bank of existing SH3. The property owner was prosecuted by TRC. Details of remediation, if undertaken, are not on file.</p> <p>The second incident relates to rubbish observed in a waterway on a farm below Mount Messenger. Inspection found only inert rubbish had been dumped and the land owner was instructed to remove the rubbish. Re-inspection found that the rubbish had been removed but the specific location of the rubbish dump and/ or the location of approved disposal are not documented.</p> <p>The proposed alignment transects the area of the filled water course and other open areas of the farm which may have been subject to waste disposal.</p>	G5 – Waste disposal to land	All locations.

Land use/ activity	Potential contaminants	Likelihood, magnitude and possible extent of contamination	HAIL reference	Sample Locations
		Therefore, there is the potential for refuse and/or near surface soils impacted by the dumped material to be encountered where the proposed alignment intersects open area of farms and in the vicinity of public rest areas adjacent to the existing SH3.		
Traffic incidents along existing SH3 leading to spills of various products	Various depending on the products spilt. May include (but not limited to) hydrocarbons, biological hazards, chemicals.	<p>Review of environmental incidents held by TRC indicated a number of reported incidents between 1999 and 2015 associated with spills along the existing SH3 in the area where the proposed alignment runs adjacent to the existing SH3.</p> <p>This included spills of various volumes of various products. All incidents were responded to and mitigated with spills contained and removed offsite as much as practical.</p> <p>There is a possible albeit low potential for contamination associated with such spills (or other unreported spills) to be encountered in the areas of the proposed earthworks associated with the proposed alignment that run adjacent to the existing SH3.</p>	Assessed as not a HAIL, as concentration of the migration of hazardous substances from these incidents to the areas of the earthworks associated with the proposed alignment are unlikely to be in sufficient quantity that it could be a risk to human health or the environment.	Not applicable
Bulk storage of fuel, chemicals and wastes associated with dry farming operation	Various depending on the products stored. May include (but not limited to) hydrocarbons and agrochemicals such as heavy metals,	<p>The alignment transects at or near the boundary of farming activities at the northern and southern end of the alignment.</p> <p>The current and historical aerial photograph review indicates that structures or storage are unlikely to have been located along the proposed alignment in these areas.</p>	Assessed as not a HAIL, as areas of the earthworks associated with the proposed alignment are unlikely to have been impacted by	Not applicable

Land use/ activity	Potential contaminants	Likelihood, magnitude and possible extent of contamination	HAIL reference	Sample Locations
	organochlorine pesticides, organo-phosphates.		bulk storage activities.	
Structures containing asbestos-containing materials (ACM)	Asbestos	<p>The property files and building plans review indicates that ACM are or have been present within buildings located at the properties at 3140 Mokau Road and 2528 Mokau Road. However, the buildings at these properties do not need to be removed or relocated for the proposed construction works.</p> <p>The current and historical aerial photo review indicates that it is unlikely that there were any dwellings and other buildings located along the alignment.</p>	Assessed as not a HAIL as no current or historical dwellings located along the alignment.	Not applicable

3 Site investigation

3.1 Data quality objectives

As described Section 1.2, the objective of this ground contamination investigation has been to evaluate soil conditions to establish the presence of contamination, if any, associated with the HAIL activities identified at the site.

The results of the available investigations have been used to establish implications for the Project and to establish procedures required during soil disturbance works.

3.2 Investigation methodology

A soil sampling plan that targeted areas along the Project alignment where HAIL activities have been identified and where construction works will result in soil disturbances was devised. Actual sample locations were limited by physical access constraints and located to minimise disruption of occupied areas of the active farm areas. The proposed sample locations were adjusted at the time of collection accordingly in coordination with the current property owners/occupiers.

Soil samples were collected from a total of 20 investigation locations, and varied between 25m and 400m spacing along the Project alignment. The sample locations are shown on Figures 3a and 3b (Appendix A).

Intrusive investigations were carried out at the site between 11th and 15th December 2017. Soil samples were collected using either a hand-auger or with a 2-tonne excavator from a test pit. Hand auger depths ranged between 1.5m and 2m below ground surface, while test pit depths ranged between 1.2m and 2.2m below ground surface. A small excavator was required due to limited access up the valleys. Test pits were able to be dug at 14 locations, and soil samples were collected from hand augers at the remaining 6 locations. The sampling location plans are included as Figures 3a and 3b (Appendix A).

Materials encountered during the investigation were logged in accordance with the NZ Geotechnical Society "Guideline for the classification and field description of soils and rocks for engineering purposes".

Samples were collected at regular depths (0.5m intervals) from the test pits or hand auger holes. The sampling procedure was as follows:

- Confirmation of the sampling location relative to local features,
- Grass scraped away using the digger bucket or a shovel, and a surface soil sample collected using a clean trowel,
- Excavation of the test pit in half meter stages with samples collected every half meter from the centre of the digger bucket using a clean trowel or by hand with fresh nitrile gloves,
- Samples were collected from clean hand auger at half meter stages using fresh gloved hands

Hand sampling equipment was cleaned between each sample with Decon90 and water. New nitrile gloves were worn for collection of each sample. For each sample, soil was placed into a clean glass jar (provided by Hills Laboratory). Samples were couriered chilled from New Plymouth to Hills Laboratory, Hamilton under chain of custody documentation.

A total of 36 samples and 3 duplicates were analysed at Hills Laboratories for concentrations of heavy metals, semi-volatile organic compounds (SVOCs) – including polycyclic aromatic hydrocarbons (PAH) and organochlorine pesticides (OCP), and total petroleum hydrocarbons (TPH).

3.3 Observations

Soil logs were made at each hand auger and test pit location, and are included in Appendix B.

Natural soils were encountered at most locations along the alignment. Top soil was present at some locations in the top 50mm to 100mm overlying silt with varying degrees of clay and sand. In most locations, the silt graded down into clay with varying degrees of organic material. Peat was encountered at 0.85m depth in CLTP12.

At the southern end of the alignment, gravels were encountered between 0.2m and 1.8m below ground in all three test pits. No foreign material was encountered in the gravels. Gravels were sub-rounded to rounded, except for angular to sub-angular gravels encountered in CLTP14 (likely fill). Gravels could be related to outflow from the Mimi catchment, or there is a possibility that at a few locations gravels from the existing SH3 road could be re-worked with local materials.

3.4 Quality assurance/quality control

Quality assurance and quality control (QA/QC) programs were implemented as part of field procedures to confirm that the soil analytical data were fit for purpose. The program included:

- Sampling equipment decontamination between sampling locations.
- Preservation of samples with ice during transport from the field to the laboratory.
- Transportation of samples with accompanying Chain of Custody documentation (Appendix D).
- Collection of laboratory replicate samples and review of calculated relative percent differences (RPDs).
- Comparison of field and analytical data.
- Compliance with sample holding times.

Standard laboratory QA/QC reports were not examined as part of this project, but are available from the laboratory on request.

A quantitative measure of the precision of the results was undertaken independently of the laboratory for a number of the sites by calculating the RPD values for replicate pairs. The RPD values were calculated using the following equation:

$$RPD := \frac{\frac{(C_0 - C_s) \cdot 100\%}{(C_0 + C_s)}}{2}$$

where C_0 = concentration obtained from the original sample
 C_s = concentration obtained from the split or duplicate sample

Three duplicate soil samples were collected during the investigation. Analyses of the duplicate samples were in addition to standard laboratory QA/QC. Table 3.1 presents the QA/QC analytical results.

Table 3.1 - Results from duplicate samples for quality control check

Location and depth	CLTP16 1.0m	CLTP16 Duplicate	RPD %	CLTP12 0.5m	CLTP12 Duplicate	RPD %	CLTP04 0.5m	CLTP04 Duplicate	RPD %
Arsenic	5	6	18	< 2	< 2	n/c	13	7	60
Cadmium	< 0.10	< 0.10	n/c	< 0.10	< 0.10	n/c	< 0.10	< 0.10	n/c
Chromium	24	24	0	15	14	7	19	20	5
Copper	16	16	0	6	6	0	10	9	11
Lead	14.7	15	1	7.9	8	1	12.5	12	7
Nickel	23	23	0	13	12	8	13	15	14
Zinc	69	72	4	45	41	9	52	59	13

RPDs calculated for the duplicate samples were typically less than 20 %. RPD values for duplicate sample pairs that are less than 50% are generally considered good.

The duplicate sample for CLTP04 varied by less than 20% for all metals with the exception of arsenic. This sample was collected from 0.5m depth in clayey silt with some reddish brown staining. The material description indicates there may be some variability within the soil layer which may account for the 60% difference in the arsenic concentrations.

Based on the above, the sampling and analytical program is considered acceptable and the results obtained are of reliable quality and suitable for interpretation taking into consideration the potential for variability in arsenic concentrations as indicated in CLTP04.

3.5 Evaluation criteria

Results have been compared to the following criteria:

- NES Soil contaminant standard and associated hierarchy documents as referred to in MfE Contaminated Land Management Guideline No. 2, directed in the NES Soil Users Guide to assess human health risks. Based on the proposed use, the standard for commercial/ industrial land use has been adopted. The commercial/industrial worker land use standard has also been adopted for assessing risks to construction workers for metal contaminants. For hydrocarbons, the maintenance worker soil acceptance criteria from the MfE Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand; and

- An environmental discharge criteria is not specified by the New Plymouth District Council (NPDC) or Taranaki Regional Council (TRC). As per common practice for regions in New Zealand without guidelines, we have adopted the Canadian Council of Ministers of the Environment (CCME) Soil Quality Guidelines (CCME) for the Protection of Environmental values for commercial/industrial use to assess potential environmental impacts.

3.6 Investigation findings

Analytical soil results from testing of 36 soil samples are presented in summary Table C.1 and Table C.2 attached as Appendix C. Full laboratory transcripts reports are included in Appendix D.

All results were below both the adopted NES Soil and CCME Environmental guidelines for commercial/industrial use being the criteria for the assessment of effects on human health and the environment. Other key findings of the results compared are as follows:

- All heavy metal concentrations were generally consistent and likely indicative of local background concentrations.
- All OCP results were below laboratory detection level.
- All PAH results were below laboratory detection levels, with the exception of trace levels concentration at CLHA02 in the surface sample. This hand auger was located near the rest area at the summit of the SH3 road. The trace PAH concentration indicates exceedance of expected background concentrations but is below the adopted human health and environmental criteria.
- All TPH results were below laboratory detection, with the exception of trace concentrations C₁₅-C₃₀ at CLTP04 in the surface sample. CLTP04 is located within the northern farm area approximately 100 m to the east of the buildings on this property. The trace TPH concentration indicates exceedance of expected background concentrations but is below the adopted human health and environmental criteria.

3.7 Conceptual site model and assessment of environmental effects

A conceptual model as defined by the MfE Contaminated Land Management Guidelines No 5: Site Investigation and Analysis of Soils (updated 2011), sets out known and potential sources of contamination, potential exposure pathways, and potential receptors. For there to be an effect from the proposed activity there has to be a contamination source and a mechanism (pathway) for contamination to affect human health or the environment (receptor).

A conceptual site model has been developed for the works associated with the proposed alignment, which takes into account the available information about the site, geological, hydrological and hydrogeological site conditions and our understanding of the potential effects on human health and the environment. The model is presented in Figure 3.1 overleaf.

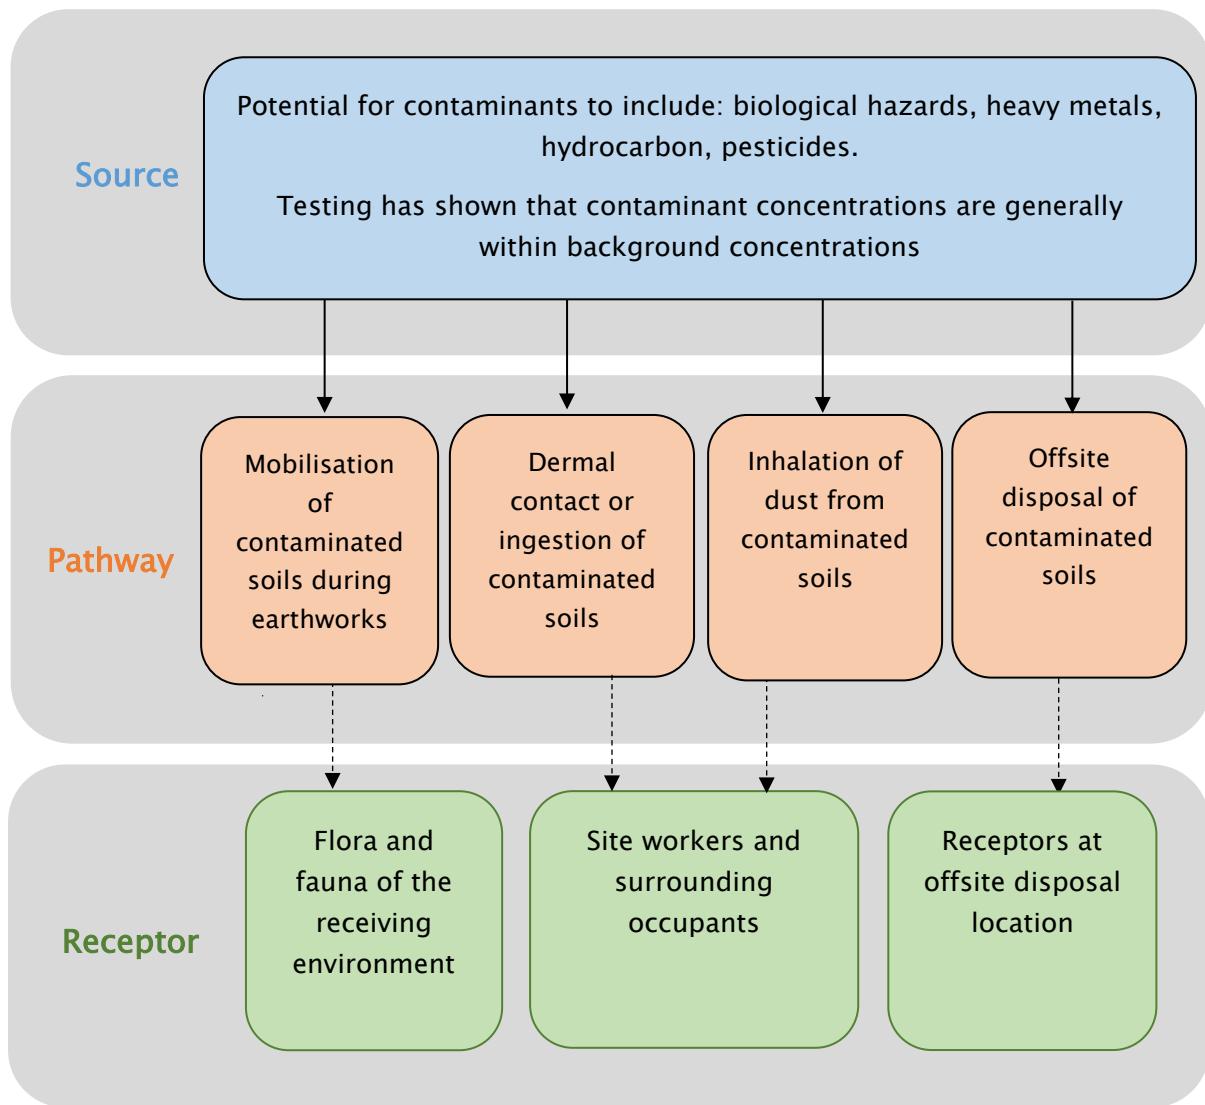

Figure 3.1 – Conceptual site model. Dash lines indicate incomplete pathways.

The conceptual site model, based on existing data, shows that there is no pathway for contaminants to pose a risk to human or environmental receptors during or at completion of the works, as they are not present in concentrations that exceed the relevant human health or environmental guidelines.

4 Implications and conclusions

A large portion of the Project area has not been subject to potential contaminating (or HAIL) activities. Potential contaminating activities (waste disposal to land) has been identified in the northern and southern extents of the Project alignment. The areas identified as potentially impacted by HAIL activities (waste disposal to land) that will be disturbed as part of the Project works have been subject to targeted soil sampling as part of this investigation. The results of this sampling indicate that the soils do not contain contaminants at a level that would present a risk to human health or the environment during or at the completion of works. Based on these results:

- No contaminated-land specific earthworks or health and safety controls therefore apply during the works.
- Soils disturbed during the Project are suitable for reuse on-site or disposal at on-site disposal locations located within the Project designation boundary, or disposed off-site at a location authorised to accept materials.

There remains the potential to encounter unexpected contamination during the proposed works. In such cases, the potential risks to human health and the environment are expected to be able to be managed during works through the implementation of appropriate controls so that the effects from contaminated land will be less than minor. Controls to identify and manage unexpected contaminated soil (if encountered) are specified in the CLMP. The CLMP details management, monitoring and reporting requirements with respect to contaminated land for the Project.

Appendix C: Results Summary Tables

Table C.1 – Summary of analytical results of soil testing – Testpit Locations

Table C.2 – Summary of analytical results of soil testing – Hand Auger Locations

Table C1: Summary of analytical results of soil testing - Testpit Locations

Notes

Bold values indicate results exceed the NES Soil standard for commercial/industrial use

Underlined values indicate results exceed CCME Tier 1 environmental guideline values for commercial / industrial use

All values are reported in mg/kg (ppm) unless otherwise stated.

NL = Not limiting (i.e >10,000mg/kg)

1.2. *Wet mining* ($n = 25$, $\text{mean} = 7.8$)

2 - CCME, 1991 (updated 2002). Canadian Environmental Quality Guidelines for the Protection of Environmental and Human Health (unless otherwise stated).

3 - NEPM 2013, Guideline on the Investigation Levels for Soil and Groundwater: commercial/industrial D.

4 - MFE 1999, Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New

⁴ - MFE, 1999. Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand. Tier 1 Soil acceptance criteria.

5 - MFE, 1999. Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand - Groundwater Protection, silty clay, contamination at < 1 m, groundwater at 2 m depth.

Notes:

Bold values indicate results exceed the NES Soil standard for commercial/industrial use

Underlined values indicate results exceed CCME Tier 1 environmental guideline values for commercial / industrial use

All values are reported in mg/kg (ppm) unless otherwise stated.

NL = Not limiting (i.e >10,000mg/kg)

1 - Ministry for the Environment (MfE), April 2012. Users Guide: National Environmental Standard for assessing and managing contaminants in soil to protect Human Health: commercial/industrial use (unless otherwise stated).

2 - CCME, 1991 (updated 2002). Canadian Environmental Quality Guidelines for the Protection of Environmental and Human Health (unless otherwise stated).

3 - NEPM 2013. Guideline on the Investigation Levels for Soil and Groundwater: commercial/industrial D.

4 - MfE, 1999. Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand. Tier 1 Soil acceptance criteria: commercial/industrial use, silty clay, <1 m.

5 - MfE, 1999. Guidelines for Assessing and Managing Petroleum Hydrocarbon Contaminated Sites in New Zealand - Groundwater Protection, silty clay, contamination at < 1 m, groundwater at 2 m depth.

Analyst's Comments

It has been noted that the spikes for SVOC on sample 1896489.35, were run as part of our in-house QC procedure, had lower than expected recoveries for Pentachlorophenol at 21% and 18%. Therefore the result maybe underestimated.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil

Test	Method Description	Default Detection Limit	Sample No
Heavy Metals, Screen Level	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion US EPA 200.2. Complies with NES Regulations. ICP-MS screen level, interference removal by Kinetic Energy Discrimination if required.	0.10 - 4 mg/kg dry wt	4-5, 7, 10, 14-15, 18, 23, 26-28, 31-32, 35-36
Semivolatile Organic Compounds Trace in Soil by GC-MS	Sonication extraction, GPC cleanup, GC-MS FS analysis. Tested on as received sample	0.002 - 6 mg/kg dry wt	4-5, 7, 10, 14-15, 18, 23, 26-28, 31-32, 35
Total Petroleum Hydrocarbons in Soil	Sonication extraction in DCM, Silica cleanup, GC-FID analysis US EPA 8015B/MfE Petroleum Industry Guidelines. Tested on as received sample [KBIs:5786,2805,10734]	8 - 60 mg/kg dry wt	4-5, 7, 10, 14-15, 18, 23, 26-28, 31-32, 35
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry), gravimetry. (Free water removed before analysis, non-soil objects such as sticks, leaves, grass and stones also removed). US EPA 3550.	0.10 g/100g as rcvd	4-5, 7, 10, 14-15, 18, 23, 26-28, 31-32, 35

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.

Analyst's Comments

It was observed that the container for sample 1897351.7 was not completely filled. Volatile loss may have occurred due to the headspace created in the container.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil

Test	Method Description	Default Detection Limit	Sample No
Heavy Metals, Screen Level	Dried sample, < 2mm fraction. Nitric/Hydrochloric acid digestion US EPA 200.2. Complies with NES Regulations. ICP-MS screen level, interference removal by Kinetic Energy Discrimination if required.	0.10 - 4 mg/kg dry wt	1, 3, 7, 11-12, 15, 19, 24-25, 29, 31, 34-35, 40
Semivolatile Organic Compounds Trace in Soil by GC-MS	Sonication extraction, GPC cleanup, GC-MS FS analysis. Tested on as received sample	0.002 - 6 mg/kg dry wt	1, 3, 7, 11-12, 15, 19, 24-25, 29, 31, 34-35
Total Petroleum Hydrocarbons in Soil	Sonication extraction in DCM, Silica cleanup, GC-FID analysis US EPA 8015B/MfE Petroleum Industry Guidelines. Tested on as received sample [KBIs:5786,2805,10734]	8 - 60 mg/kg dry wt	1, 3, 7, 11-12, 15, 19, 24-25, 29, 31, 34-35
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry), gravimetry. (Free water removed before analysis, non-soil objects such as sticks, leaves, grass and stones also removed). US EPA 3550.	0.10 g/100g as rcvd	1, 3, 7, 11-12, 15, 19, 24-25, 29, 31, 34-35

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.

SUMMARY OF METHODS

The following table(s) gives a brief description of the methods used to conduct the analyses for this job. The detection limits given below are those attainable in a relatively clean matrix. Detection limits may be higher for individual samples should insufficient sample be available, or if the matrix requires that dilutions be performed during analysis.

Sample Type: Soil			
Test	Method Description	Default Detection Limit	Sample No
Heavy Metals, Screen Level	Dried sample, <2mm fraction. Nitric/Hydrochloric acid digestion US EPA 200.2. Complies with NES Regulations. ICP-MS screen level, interference removal by Kinetic Energy Discrimination if required.	0.10 - 4 mg/kg dry wt	4, 6-7, 12-13, 16, 18, 21, 23, 25
Semivolatile Organic Compounds Trace in Soil by GC-MS	Sonication extraction, GPC cleanup, GC-MS FS analysis. Tested on as received sample	0.002 - 6 mg/kg dry wt	4, 6-7, 12-13, 16, 18, 21, 23
Total Petroleum Hydrocarbons in Soil	Sonication extraction in DCM, Silica cleanup, GC-FID analysis US EPA 8015B/MfE Petroleum Industry Guidelines. Tested on as received sample [KBI's:5786,2805,10734]	8 - 60 mg/kg dry wt	4, 6-7, 12-13, 16, 18, 21, 23
Dry Matter (Env)	Dried at 103°C for 4-22hr (removes 3-5% more water than air dry), gravimetry. (Free water removed before analysis, non-soil objects such as sticks, leaves, grass and stones also removed). US EPA 3550.	0.10 g/100g as rcvd	4, 6-7, 12-13, 16, 18, 21, 23

These samples were collected by yourselves (or your agent) and analysed as received at the laboratory.

Samples are held at the laboratory after reporting for a length of time depending on the preservation used and the stability of the analytes being tested. Once the storage period is completed the samples are discarded unless otherwise advised by the client.

This report must not be reproduced, except in full, without the written consent of the signatory.

A handwritten signature in dark ink, appearing to read "K Harrison".
